## CONTENT

- Let's Start! • Let's Explore! • Let's Practice! • Extension Activity • Target Words • Learning Points

### Let's Start!

Have you studied conditional statements before?

### Learning Outcome:

Talk about important information about client software for the identity metasystem

Describe a general-purpose computer programming language

Talk about principles, concepts, characteristics of general-purpose computer programming language

### Can Do Statements:

- I can explain what the Java if statement is.
- I can exchange information about examples of if statements in Java.
- I can explain the consequences of using an if/else statement in Java.

### Ask your partner:

- What kind of conditional statements do you know?
- What expression do you know to run two different processes at the same time?

## Let's Explore!

Catherine explains everything about the if statement in Java.

*Instructions: Read the text below.*

- John:** Hey, Cat! How's it going? Thank you so much for your help last time, you really helped me a lot. We should study together for the next test!
- Catherine:** Sure! Why not? Have you started reading the new assigned books?
- John:** What new books?
- Catherine:** The ones about the "if" statements. You should study more!. This is one of the most difficult topics.
- John:** You should give me a quick review of what an "if" statement is.
- John:** You should give me a quick review of what an "if" statement is.
- Catherine:** The "if statement" is one of the most used Boolean expressions. The "if statement" and the "if-else statements" can also be called "forks" or decision making statements. They have one or more conditional statements to be evaluated and they go along a conditional outcome. The "if-statement" will be executed when the condition is determined to be true, and the if-else statement will be executed when the condition is false.
- John:** Okay, I see. I think you should give me an example of a Java "if" statement.
- Catherine:** Sure, this is the most common example. Imagine we can change the color of the page by entering a numerical value. Java has to make the background of the page red if the value I enter is smaller than 5.
- John:** Okay, can you tell me what happens when an "If/else" statement is executed?
- Catherine:** Well, in the "if/else statement" there are two conditional situations. The first one is when the value is evaluated as "true", and the second one, when it is evaluated as "false" in which the "else" part is executed. So, to continue with our previous example: if I enter something bigger than 5 the "If-else" statement will be executed, making the background blue instead.

## Let's Practice!

### Evaluating Some Words Before Use the If Statements

*Instructions: Select the best options in the table.*

|           | A way to perform actions depending on what a programmer wants to develop | An instruction provided to a computer through a programming language | System of logical thought used to create true or false statements | To carry out a process | to conclude after observation or examination |
|-----------|--------------------------------------------------------------------------|----------------------------------------------------------------------|-------------------------------------------------------------------|------------------------|----------------------------------------------|
| execution |                                                                          |                                                                      |                                                                   |                        |                                              |
| Statement |                                                                          |                                                                      |                                                                   |                        |                                              |
| Boolean   |                                                                          |                                                                      |                                                                   |                        |                                              |
| condition |                                                                          |                                                                      |                                                                   |                        |                                              |
| determine |                                                                          |                                                                      |                                                                   |                        |                                              |

## Let's Practice!

Sam is giving advice to Laura on what to study for the next exam.

*Instructions: Use the words from the box to correctly complete the paragraph.*

should start / simplest way / The easiest  
true or false / Boolean expression / should also learn

You \_\_\_\_\_ by reading the definition of an "if statement". \_\_\_\_\_ way to understand its whole meaning is by searching what a \_\_\_\_\_ is. You'll probably find it is all about evaluating any expression and determine if it is \_\_\_\_\_. Remember you \_\_\_\_\_ the format in which you add the variables, and that's it! In my opinion, this is the \_\_\_\_\_ to get how it works.

## Extension Activity

If statement clarifications.

*Instructions: Complete the following steps. Fill in the Self-Assessment.*

- Look for information about the if/else statement syntax examples.
- Write notes and make a chart where you describe many examples of the "if statements".
- Read aloud the examples and share with your partner.

### Self-Assessment

Yes

No

- I look for information about the if/else statement syntax examples.
- I design chart where you describe many examples of the "if statements".
- I talk about the "if statement" examples and its usages.

☐ ☐
☐ ☐
☐ ☐

## Target Words

- **review** (noun): a summary of the most important part of a subject  
e.g. You should give me a quick review of what an "if" statement is.
- **conditional statement** (noun): a condition that is stated in an expression  
e.g. They have one or more conditional statements to be evaluated and they go along a conditional outcome.
- **evaluate** (verb): to test an expression  
e.g. They have one or more conditional statements to be evaluated and they go along a conditional outcome.
- **go along with** (verb): to go together with another thing.  
e.g. They have one or more conditional statements to be evaluated and they go along a conditional outcome.
- **determine** (verb): to conclude after observation or examination  
e.g. The "if-statement" will be executed when the condition is determined to be true.

## Learning Points

### Should for what is advisable.

Should is used for mild obligation and advices.

Should is an auxiliary verb used to give advice or recommendation and mild obligation. It is also used to say that something is a good idea.

**Form:** should+ base form of the verb  
You **should read more** about the "if statements".

Should is followed by a verb in the base form and not by a "to infinitive"  
~~You should to use fork to run more than one process.~~

**Should** as any modal verb doesn't agree with the subject in time and person.

### Examples

- *Programmers should use fork for complex programs*
- *You should use more than one "if statements"*

### Superlative

Superlatives are the form of an adjective that indicates it has the greatest quality.

Use superlative adjectives when you want to compare 3 or more nouns to the highest degree.

Generally, when the adjective has one syllable we add the **-est** ending to form a superlative.

e.g. clean-clean**est**

If there is a vowel followed by a consonant at the end of the adjective, we double the last consonant.

e.g. hot- hot**test**

If the adjective ends in **-y** , we change it to **i**

e.g. happy- happi**est**

Exceptions: Some superlatives that are formed using **the most**:

**Fun**- the most fun (not funnest)

**Real** – the most real (not realest)

**Right** – the most right (not rightest)

**wrong**– the most wrong (not wrongest)

## Learning Points

---

Some adjectives can take the **-est ending** or be formed with **the most**.

**Clever** - the most clever, the cleverest

**Simple** - the most simple, the simplest

Adjectives with more than two syllables take **the most**.

Beautiful- **the most** beautiful

Interesting- **the most** interesting

### Examples

- *The most interesting operation in Java is "fork" keyword.*
- *The simplest operation to understand is the "if statement".*
