Let's Start!

Before writing codes, there's something you have to know...

Learning Outcome:

Understand important information about client software for the identity metasystem in spoken or written documents.

Ask your partner:

- What is Java useful for? Share your thoughts.
- What is the relationship between codes and Java? Explain.

Can Do Statements:

- I can talk about the importance of primitive data types in Java.
- I can list different types of primitive data in Java.
- I can give characteristics of different types of primitive data in Java to offer a service to a client.

Let's Explore!

Instructing* others

*To "instruct" means to teach others about something.

Instructions: Read the text below.

Piper: Larry, what have you learned these days?

Larry: In school, we have checked the primitive data types in Java.

Piper: I didn't learn much about systems and all that stuff.

Larry: Well, you are not going to have to keep underestimating it because they are extremely important in the systems field. These primitive data types are the most basic ones in Java and allow people to contain pure and simple values; furthermore, each data type serves a unique purpose that cannot be changed and that adjusts, throughout codes, to the particular system's needs.

Piper: What did you do to learn so much about that?

Larry: I just studied. Now, if you want to become knowledgeable about this area, you haven't got to forget that we have different primitive data types. I remember that we had two main categories, the Boolean and Numeric data types, from which we got subcategories such as the character, the integral, the floating-point-group and the integer group, among others. You haven't got to memorize them. Did you get the idea?

Piper: You are not going to make me understand that unless you give me some examples.

Larry: Sure, each data type provides the client with a service and outcome. I recall that you used the Boolean Data Type which allowed you to work with two different possible values, true or false, in order to assess the conditions that allowed you to come up with the desired output for the client. On the other hand, within the numeric data types, we had the Character type which is the only one that allows people to include any type of character or symbol within the code. All the rest represents actual numeric values in bytes of memory consumption.

Let's Practice!

Let's try to remember how important this is!

*Instructions: Read the sentences. Write the missing word in the blank. Use: **got to make , going to have to use , haven't got , are not going to , haven't***

1. You _____ got to learn everything, just remember that these primitive data types are very important.
2. You _____ have to use them for different purposes because each one of these primitive data types serve a unique one.
3. They _____ to forget that they are the most basic bits of information.
4. You are not _____ multiple codes because these primitive data types contain pure values.
5. You haven't _____ this complicated, don't forget primitive data types comprise simple values.

Let's Practice!

Have you done this before?

Instructions: Select the correct answer in order to complete the sentence.

1. _____ you used the primitive data types before?
 - a. Have
 - b. Has
 - c. Did
2. I have _____ the character data type to include symbols within the code.
 - a. used
 - b. use
 - c. using
3. Has he _____ with two possible values?
 - a. worked
 - b. working
 - c. works
4. _____ the data type provided the client with a service?
 - a. Has
 - b. Have
 - c. Having

Extension Activity

Let's find more information about primitive data types!

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for more details about primitive data types.
- Make a mind map with all the information you find.
- Share your mind map with the class.

Self-Assessment

Yes

No

- I search information about primitive data types.
- I create a mind map showing details about primitive data types.
- I discuss my map with my partners

☐	☐
☐	☐
☐	☐

Target Words

- **underestimate** (verb): to not understand the real importance or value of something
e.g. Well, you are not going to have to keep underestimating it because they are extremely important in the systems field.
- **desire** (verb): to want to achieve or reach something
e.g. I recall that you used the Boolean Data Type which allowed you to work with two different possible values, true or false, in order to assess the conditions that allowed you to come up with the desired output for the client.
- **knowledgeable** (adjective): the characteristic of knowing a lot of information about something
e.g. Now, if you want to become knowledgeable about this area, you haven't got to forget that we have different primitive data types.
- **numeric data type** (noun): one of the two categories of the primitive data type which presents subcategories that include different numeric values and corresponding memory bytes
e.g. I remember that we had two main categories, the Boolean and Numeric data types, from which we got subcategories such as the character, the integral, the floating-point-group and the integer group, among others.
- **outcome** (noun): the result of a process or action
e.g. Sure, each data type provides the client with a service, an outcome.
- **field** (noun): a specific area of study
e.g. Well, you are not going to have to keep underestimating it because they are extremely important in the systems field.

Learning Points

Present Perfect versus Past Simple: Questions and Affirmative Form

You use the Present Perfect as well as the Past Simple on a daily basis. They are important to express yourself in a natural way about events that took place in the past.

Present Perfect

Using the Present Perfect implies the idea that the event you are referring to started at an unknown moment in the past and that it continued until the present. Plus, you do not know when this event or action will finish.

Remember that there is an auxiliary verb, **have/has**, which is needed in this tense and that changes according to the pronoun being used. Plus, the verbs have to be conjugated in the past participle form.

In this table you can see the way you use the auxiliary verb have:

I	Have
You	Have
He	Has
She	Has
It	Has
We	Have
They	Have

For affirmative sentences, you have to follow the structure:

Subject + has/have + verb (past participle form) + complement

Example:

*I **have used** Java.*

For questions, the structure changes depending on the type of question.

For yes/no questions follow the structure:

Have /Has + subject + verb (past participle) + complement + ?

Example:

***Have** you **used** primitive data types?*

For open questions, follow the structure:

Wh- + have /has + subject + verb (past participle) + complement + ?

Learning Points

Example:

What primitive data types **have** you **used** before?

SIMPLE PAST

Using the Simple Past tense implies the idea that the event or action that you are making reference to started and finished at a specific moment in the past. It is no longer happening in the present.

Remember that depending on the type of verb, regular or irregular, it will change in its Simple Past form. Plus, the interrogative form must include the auxiliary verb "did".

For affirmative sentences use the following structure:

Subject + verb in past + complement

Example:

I used the primitive data types last class.

For questions, the structure changes depending on the type of question. For yes/no questions follow the structure:

Did + subject + verb (base form) + complement + ?

Example:

Did you **follow** the instructions for Java?

For open questions, follow the structure:

Wh- + did + subject + verb (base form) + complement + ?

Example:

Why did you **program** this using Java?

Examples

- *Larry, what have you learnt in the past weeks?*
- *What did you do to learn so much about that?*
- *Did you get the idea?*
- *What have you learned these days?*

Learning Points

Have Got to for What Is Necessary (Negative Form)

Have got to, in its negative form, shows the idea that something is not necessary. When you use **have got to** in the negative form, the idea that something is not necessary comes with it. You are mentioning that there is no need to proceed in a specific way regarding a situation.

The structure that you follow to create negative sentences with this expression is:

Subject + have/has + not + got to + verb (base form) + complement.

Example:

These systems **haven't got to consume** so many bytes.

He **hasn't got to study** the Boolean Data Type.

Examples

- *You haven't got to memorize them.*
- *Now, if you want to become knowledgeable about this area, you haven't got to forget that we have different primitive data types.*
