Let's Start!

Using final keywords in Java

Learning Outcome:

Talk about principles, concepts, characteristics of general-purpose computer programming language in spoken and written situations.

Ask your partner:

- Do you think it is possible to write a perfectly clean code? Why? Why not?
- In your opinion, what are the most difficult aspects of programming in Java?

Can Do Statements:

- I can say what final means in Java.
- I can talk about the importance of final keywords in classes and subclasses in Java.
- I can explain methods and variables related to final keywords in Java.

Let's Explore!

A programmer assistant is talking about the problems she has with a video game.

Instructions: Read the text below.

- Assistant:** Good morning, Mr. Jones. I'm supposed to have finished this new video game, but it isn't working as it's supposed to.
- Programmer:** Let me have a look. Hmm, OK. First of all, you have written too many final keywords.
- Assistant:** I thought that the main purpose of final keywords, when assigned to a class, is that it cannot be extended and when assigned to a method, it cannot be overridden by any subclasses, so its content cannot be changed by an outsider. In the case of a variable, it cannot be reassigned to a different object. All these are supposed to ensure security and it's hard to hack.
- Programmer:** That's perfect. However, you'd rather not spread final keywords all over your code. There are some good uses of final, such as the occasional final constant.
- Assistant:** So, shall I change it all?
- Programmer:** Not all. There is some good stuff here. Make it work and then clean it.
- Assistant:** Thank you, Sir. However, I know that a clean code is quite difficult to achieve.
- Programmer:** You'd rather not work alone. Remember that writing a code is like writing any other thing. First, you make a draft and then you check it. Work with another person that can proofread your work. A readable code is important because it is executable. Apart from that, codes are supposed to be readable for humans as well. A clean code makes it easier for other people to enhance it. I know that codes are tighter than any other piece of writing but try to keep it simple; for example, in this case, a function is supposed to do just one thing.

 - a. s supposed
 - b. are supposed
 - c. be supposed
 - d. been supposed
2. Apart from that, codes _____ to be readable for humans as well.
 - a. is supposed

 - c. be supposed
 - d. 's supposed
3. First, you are _____ a draft and then you check it.
 - a. suppose to make
 - b. supposed made
 - c. supposed to make
 - d. supposed make

**Let's Practice!**

A programmer's assistant describes the relevance of final keywords.

Instructions: Write the words to correctly complete the sentences. Use words from the box below. Use: supposed to help, supposed to, supposed, is supposed to, is supposed.

1. A keyword is _____ you find easily a specific line in huge amounts of code.
2. In order to achieve high language standards when programming, a code _____ be readable in different languages.
3. Classes are _____ to require that keywords are not extended.
4. A subclass is not _____ override a method.
5. The use of keywords _____ to avoid a hack.

Final Keywords Explanation

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for information about examples of final keywords in Java syntax.

Target Words

- **override** (verb): to ignore
e.g. When it is assigned to a method, it cannot be overridden by any subclasses.
- **class** (noun): a blueprint that describes the behavior that an object of its type has
e.g. I thought that the main purpose of final keywords, when assigned to a class, is that it cannot be extended.
- **subclass** (noun): a class that has inherited the code from a previous class
e.g. It cannot be overridden by any subclasses, so its content cannot be changed by an outsider.
- **constant** (noun): a variable that has been assigned as final so it never changes
e.g. There are some good uses of final, such as the occasional final constant.
- **readable** (adjective): easy to read
e.g. A readable code is important because it is executable.

Learning Points

Be Supposed To: Affirmative Form

When we want to express that something is expected or required from someone or something, we can use the structure **be supposed to**.

Be supposed to in its present simple form is used to say that something is expected or required to happen.

Take a look at the following structure:

Subject + am/is/are + supposed to + verb base form + complement

Example:

*Final in Java **is supposed to help** programmers create tighter and more readable code.*

Examples

- *I'm supposed to have finished this new video game, but it isn't working as it's supposed to.*
- *All these are supposed to ensure security and it's hard to hack.*
- *Apart from that, codes are supposed to be readable for humans as well.*

Would Rather for What Is Preferable in Negative Form

Use **would rather not** to express that it is not preferable to do something.

Would rather not is usually used to say that you would not prefer to do something.

Structure:

Subject + **would rather** + **not** + base form of the verb

Example:

I'd rather not use unreadable codes.

Examples

- *However, you'd rather not spread final keywords all over your code.*
- *You'd rather not work alone. Remember that writing a code is like writing any other thing.*
